Coupling identification: Simple and safely connecting

We all know the problem: Which coupling goes in which port? The mounting interface is usually clearly marked on the tractor, but the adhesive labels on the hoses on the tractor attachments have long since worn away. What sounds harmless can have expensive consequences because if connections are incorrect, hydraulic components can be damaged! Hydac has addressed this problem and developed new identification collars for hose assemblies. A patent has been applied for and these plastic ferrules are available in standard colours black, red, green and blue. Of course, the collars are also marked with a corresponding plus or minus sign for the direction of flow of oil. Installation could not be simpler: the identification ferrules are simply pushed onto the thread of the coupling and remain in position permanently thanks to their special design. So the user is protected from costly downtime and repairs.

Product advantages:

- Clear identification of the hydraulic lines from the attachment to the tractor and vice versa
- Provides identification on the attachment
- Firmly fixed
- Captive design
- Can be removed and replaced
- Lines can be connected reliably and without any risk of confusion
- Prevents damage caused by incorrect connection
- Free of burrs and processing residues

Technical specifications:

Size 10, 12, 20, 25 | ISO 7241-1, Series A
